1. Problem Statement

Sesha is developing a weather monitoring system for a region with multiple weather stations. Each weather station collects temperature data hourly and stores it in a 2D array.

Write a program that can add the temperature data from two different weather stations to create a combined temperature record for the region.

Input Format

The first line of input consists of two space-separated integers N and M, representing the number of rows and columns of the matrices, respectively.

The next N lines consist of M space-separated integers, representing the values of the first matrix.

The following N lines consist of M space-separated integers, representing the values of the second matrix.

Output Format

The output prints the addition of the two matrices in N rows and M columns, representing the combined temperature record.

Refer to the sample output for formatting specifications.

// You are using Java

import java.util.*;

```
public class Main{
    public static void main(String[] args){
        Scanner sc=new Scanner(System.in);
        int n=sc.nextInt();
        int m=sc.nextInt();
        int arr1[][]=new int[n][m];
        int arr2[][]=new int[n][m];
        int arr3[][]=new int[n][m];
```

```
        for(int i=0;i<n;i++){
            for(int j=0;j<m;j++){
                arr1[i][j]=sc.nextInt();
            }
        }
    }
}
```

```
for(int i=0;i<n;i++){
    for(int j=0;j<m;j++){
        arr2[i][j]=sc.nextInt();
    }
}

for(int i=0;i<n;i++){
    for(int j=0;j<m;j++){
